1

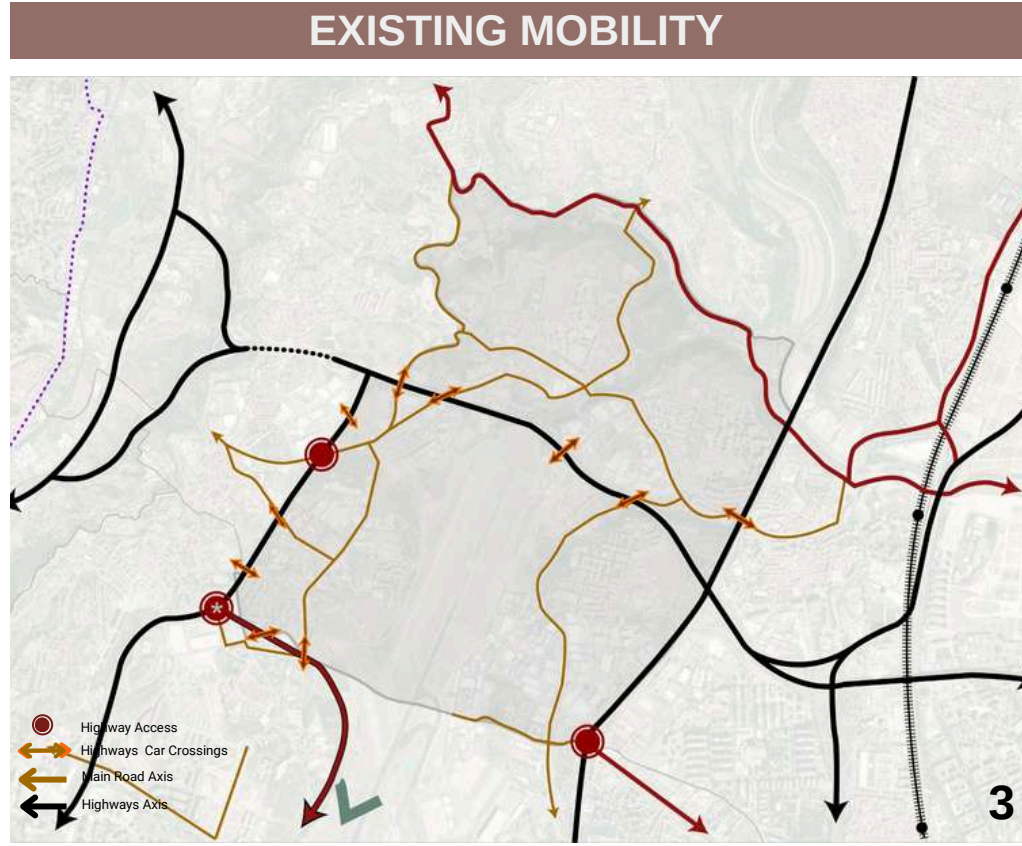

The project aims, together with Loures Municipality, to contribute to an integrated territorial diagnosis of the post-airport and its surroundings area in Loures by developing a multidisciplinary analysis as the future regeneration strategy. The goal of our project was to create an integrated gateway to Loures by transforming the existing industrial fabric into a more diverse, green and mixed-use urban area.

SWOT ANALYSIS

- Proximity to Lisbon
- Site is in critical development area.
- With the airport's relocation, the vacated areas will allow new uses enhancing the urban fabric and address current gaps.
- The existing plans and planning tools (ARU, social housing, DP in Prior Velho)
- Dominance of active population, creating mixed zones opportunities.
- Connectivity to neighbouring centralities through car centric connections
- Dominance of logistics and industrial activities overshadows public facilities and creates fragmentation.
- Low pedestrian connectivity (int. and ext.) within the existing centralities (car centric)
- Fragmented public parks and greens.
- The mobility network lacks clear, effective connections to/from major infrastructure.
- The possible loss of infrastructure around the airport due to its reallocation.

- Proposed and existing mobility infrastructure could create new possible connections and incentives towards new mobility interface.
- New planning paradigms towards a more sustainable development (green and soft mobility, 15 min cities concept, MetropublicNet, NBS concept) leading to new investment and development.

- The changing immigration policies and aging could lead to desertification and abandonment of urban structures (building, facilities, space)
- The housing crisis could lead to possible Gentrification and rise in informal settlements if not well regulated. Specially due to lack of data and efficient governance tools.

AIM: TOWARDS A UNIFIED GATEWAY OF LOURES BUILT ON SUSTAINABLE/REGENERATIVE DIRECTIVES

11

New axis in the airport area

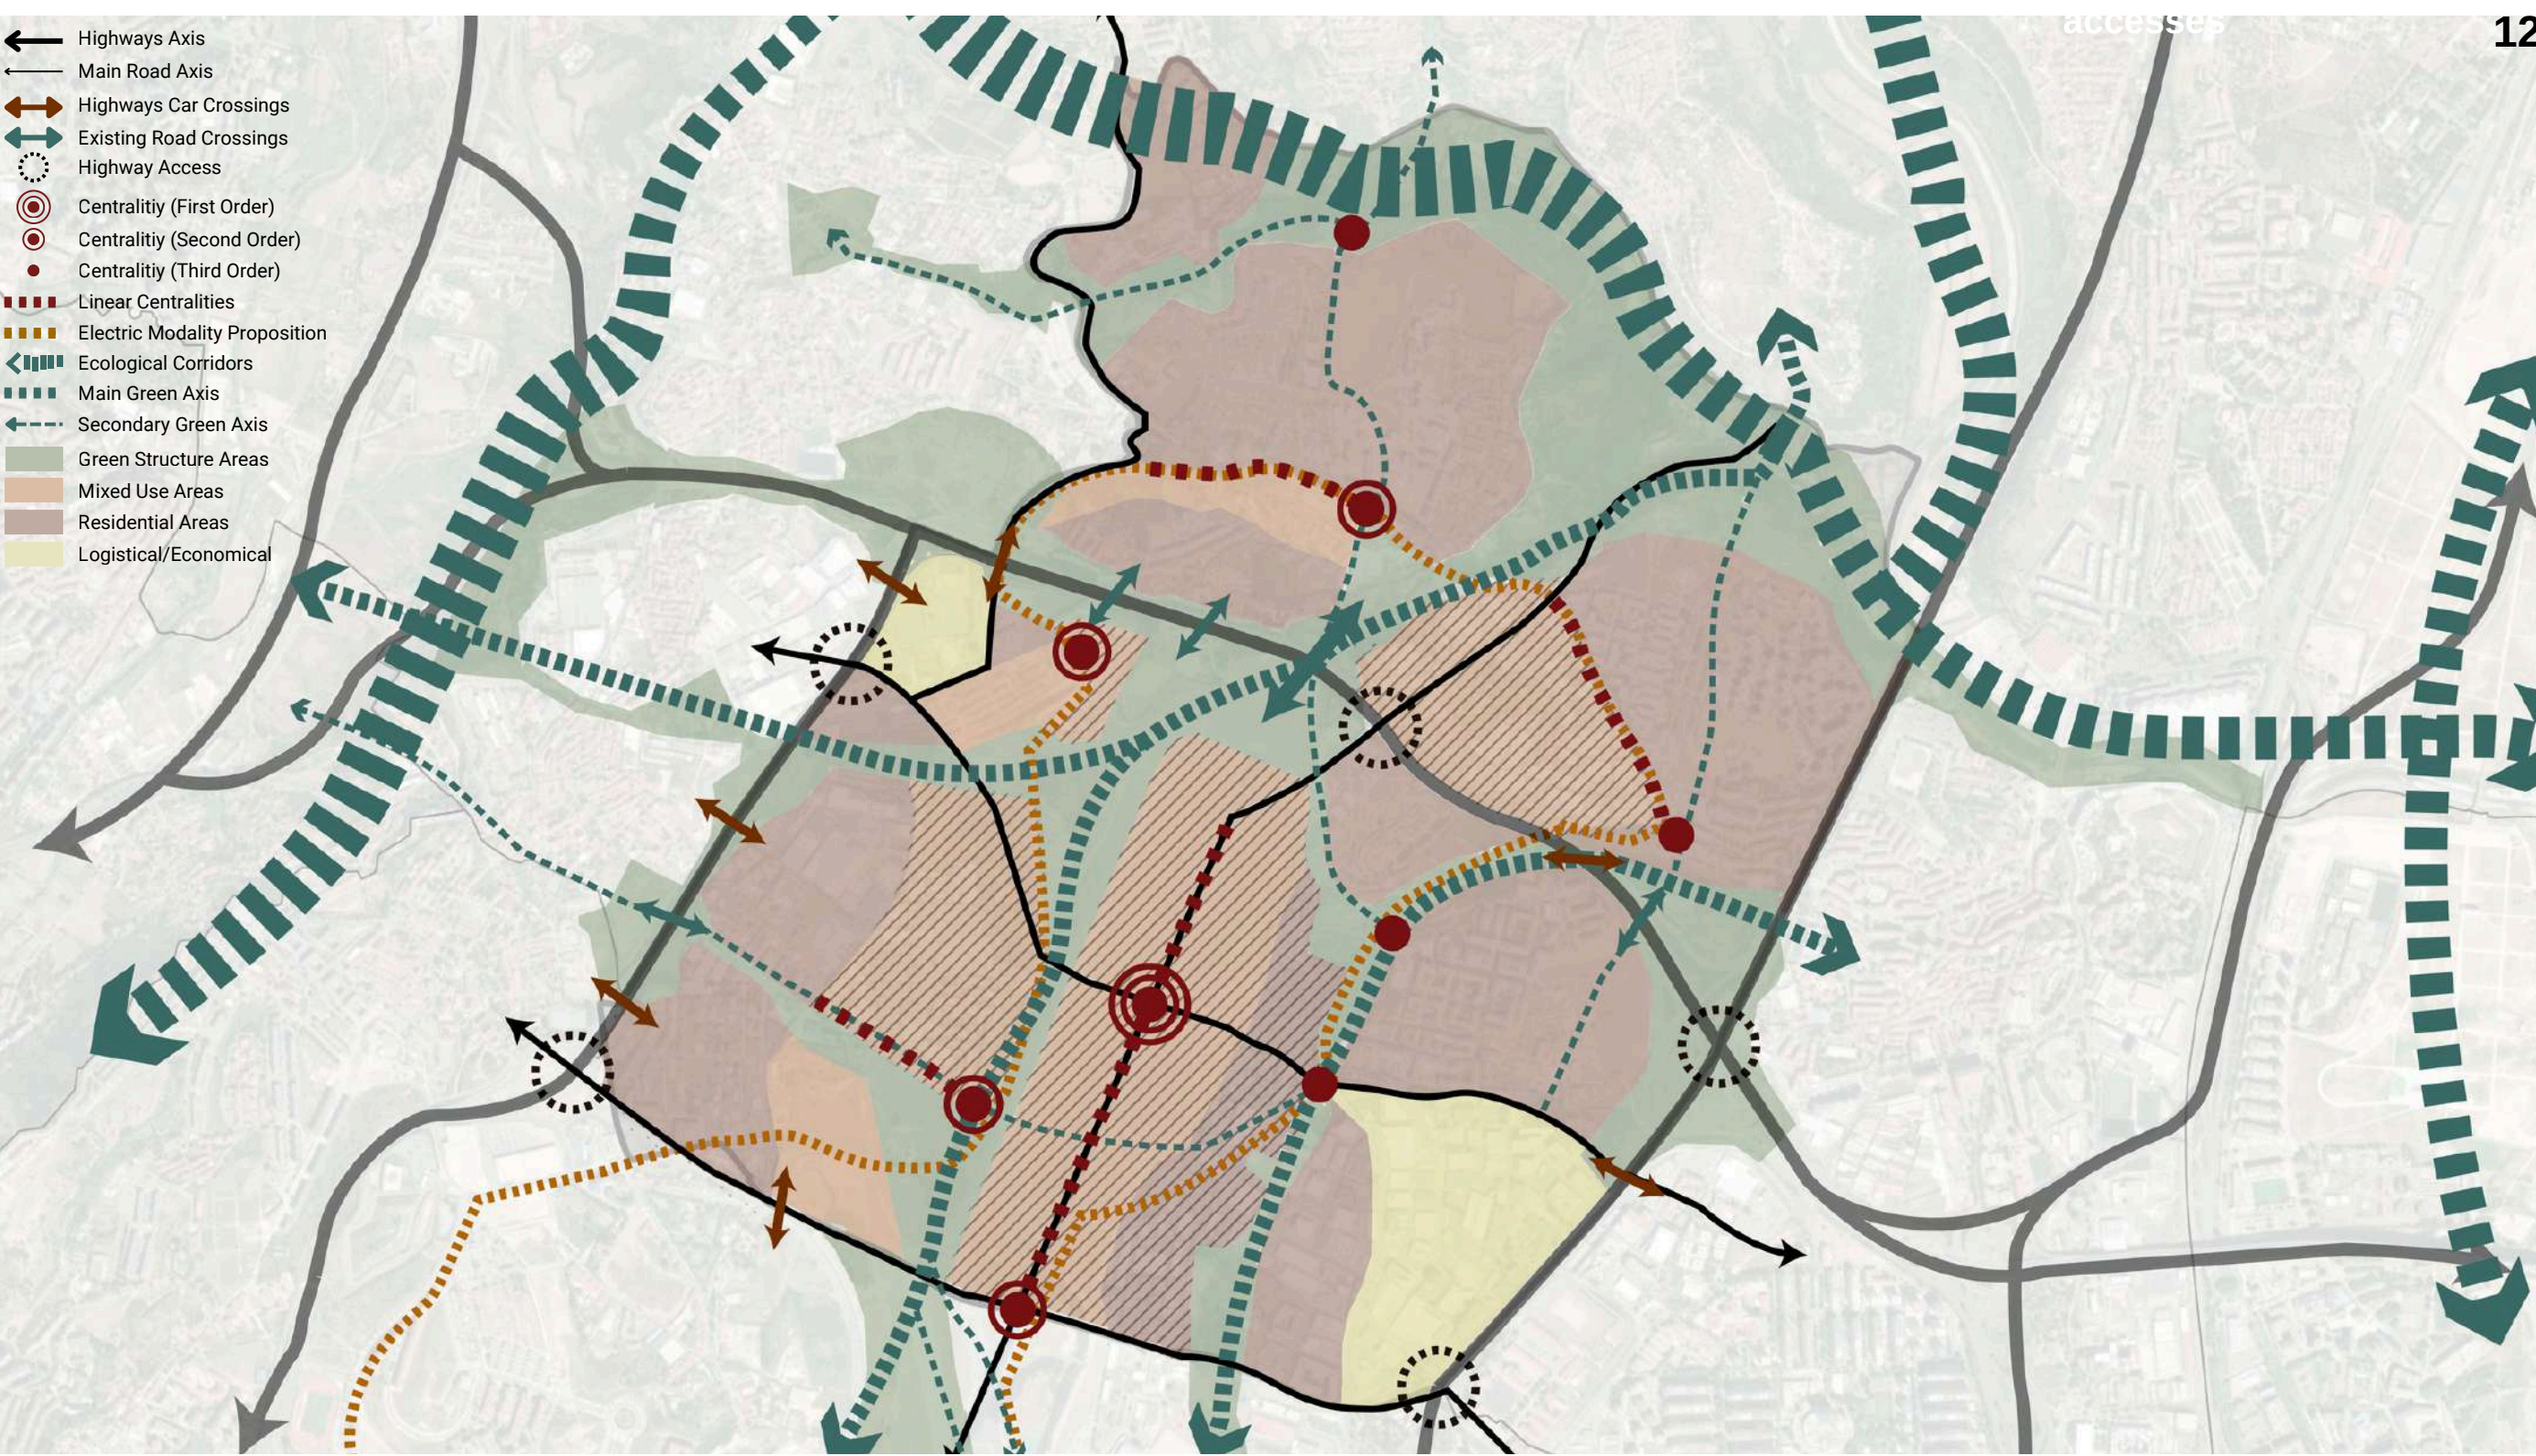

New public facilities

Regeneration of interstitial spaces

Parks and green spaces

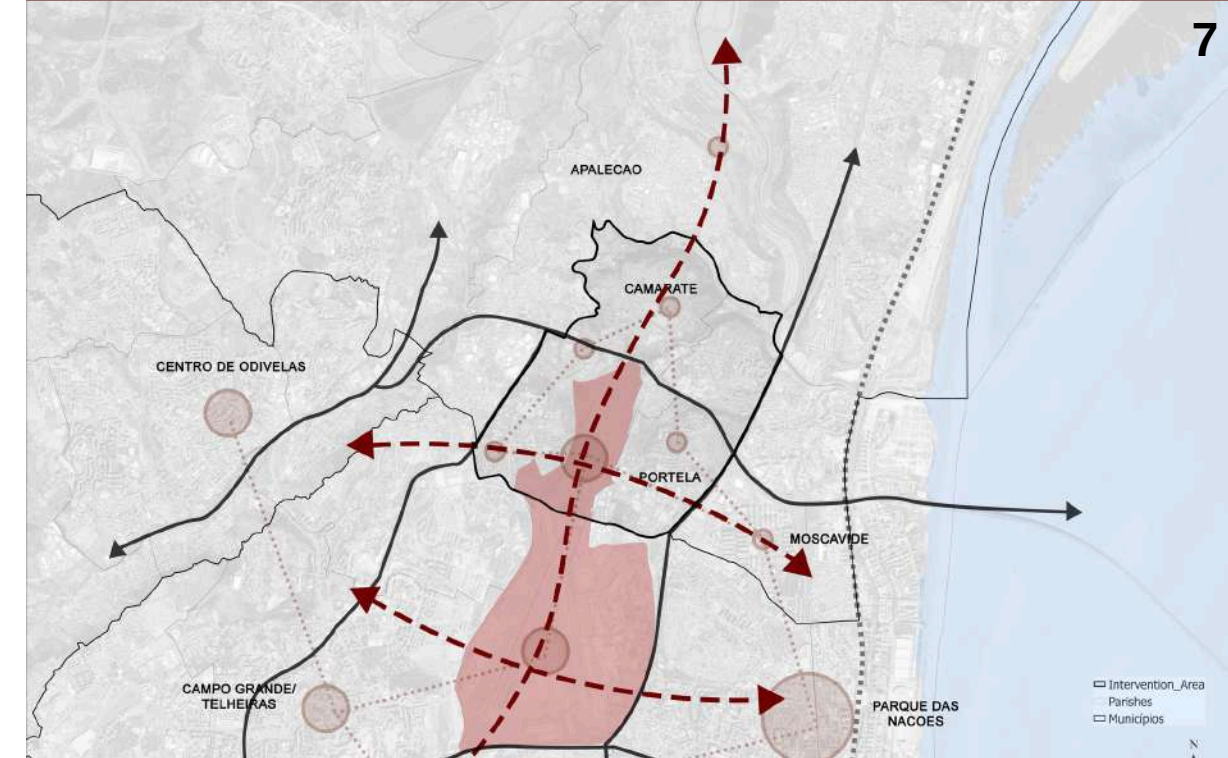

Reconversion towards mixed use

Pedestrian Highway Crossings and new accesses

The project focused on identifying and delineating private land suitable for potential land subdivision. A land parcel of approximately 3 hectares was selected within the territorial study area. This site was chosen due to its strategic position within an area formerly dedicated to logistics activities and its proximity to the Camarate neighbourhood, allowing for the integration of the consolidated urban fabric with the surrounding underutilized and expectant land. The selection was aligned with the proposed territorial land-use strategy, which included a mixed-use zone combined with a green corridor
